1. Ensure that the probe with the blue ejection button and blue probe well are installed.

2. Remove the probe from the probe well.

3. Press Mode Selection button to select the Pediatric Axillary Mode.

4. Observe the Pediatric Axillary Mode indicator on the display (flashing Pediatric axillary icon).

5. Load a Welch Allyn probe cover.

6. Adjust clothing to visualize the axilla.

7. Avoid folds in the axilla and place the probe tip vertically as high as you can as shown.

8. Place the arm snugly at the child’s side. Hold in this position without movement of the arm or probe during the measurement cycle.
Tips for Taking Pediatric Axillary Temperatures with SureTemp® Plus

1. Avoid contact with electrodes, wires, tape, clothing, etc.

2. Ensure the probe tip is completely surrounded by tissue at all times. Prolonged exposure of the axilla to ambient air can cause inaccurate readings.

3. Use of Welch Allyn disposable probe covers is recommended. Use of any other probe cover may result in inaccurate temperature readings.

4. If you question a reading, recheck the temperature using the Monitor Mode on your thermometer. Take an axillary temperature as described.

   > Continue to hold the probe in place after the temperature displays

   > Press the Mode Selection button until the Monitor Mode indicator appears on the screen

   > Continue taking the temperature for approximately five minutes

   > Long-term continuous monitoring is not recommended in any mode
